Synopsis

Piled foundations have traditionally been designed using empirical methods, such as the capacity based approach which the majority of codes of practice are based on. However, new research has led to substantial developments in the analysis of pile groups and piled rafts, and provided deeper insights into the mechanisms for the interaction between piles, soil and rafts or caps.

Based on thirty years of experimental and theoretical research, the course will give an overview of current piled foundation design practice as well as the examination of recent advances in the analysis and design of piled rafts.
